I	<ol style="list-style-type: none"> 1. It states that the illumination of a surface is inversely proportional to the square of the distance between the surface and light source provided, the light source is a point source 2. The MHCP of a lamp is the average candle power in the horizontal plane passing through the luminous centre of the lamp 3. Clearance from buildings of high and extra high voltage lines 4. Rod earthing, Strip earthing, Pipe earthing, Plate earthing 5. Between conductor and structure is 1.3m 		<p>2</p> <p>2</p> <p>2</p> <p>2</p> <p>2</p>
II	<ol style="list-style-type: none"> 1. When connected to supply, full voltage appears across the starter terminals due to low resistance of the electrodes and small current through choke. As the starter is filled with argon gas, it ionises and a glow appears inside the starter. This glow warms up the bimetallic strip and short - circuits the starter terminals. this causes maximum current through the electrodes and choke. thus results in thermionic emission at electrodes and ionises the argon gas inside the tube. 	3

 Illumination at b due to L1 = 3.079 Lux
 Illumination at b due to L2 = 16.32 Lux
 Total at B due to L1 & L2 = 19.4 Lux

b

When the lamp is switched on the voltage appears across the auxiliary electrode and nearly main electrode. The argon gas between these two electrodes is first ionised because of small distance between them and an arc takes place between them. The small arc flow results in building up of pressure due to warming or heating of mercury which is originally in the condensed form. Ultimately the discharge take place between the two main electrodes, Due to low resistance of the ionised path between the two main electrodes the discharge shifts from auxiliary electrode circuit to main electrodes.

Control panel

M1 to M3 Motors

a) Current drawn by 10HP motor

Full-load current of the motor (I_L) = Rating/ $\sqrt{3}VLCos \phi \eta$ (12.61A)

Starting Current = 2 x 12.61 = 25.23A

b) Current drawn by 5HP motor

Full-load current of the motor (I_L) = Rating/ $\sqrt{3}VLCos \phi \eta$ (6.31A)

Starting Current = 2 x 6.31 = 12.62A

c) Total Current of the main control = 12.61 x 1 + 6.31 x 2 = 25.23A

d) Starting current of main control = 2 x 12.61 + 6.31 + 6.31 = 37.84A
